

**Using your favorite search engine or the resources of your library, identify firewall issues that might arise for a company that uses cloud computing in its online sales system. In about 100 words, summarize your findings in terms of the perimeter expansion problem.**

In terms of the perimeter expansion problem, there are a few firewall issues that might arise for a company that uses cloud computing in its online sales system. As more and more companies allow employees to work offsite, there are more computers needing to be protected by the firewalls the company uses to keep their information secure and with cloud firewalls. More computers mean it's more likely data breaches could occur because of human error causing holes in the perimeter. With more computers to protect it also likely a company uses more than one service provider, which can cause misconfigurations if the providers' configurations don't align with each other.
